

## Use of Bi-level devices as invasive ventilators: guidelines for clinicians

### Advisory on the Use of ResMed VPAP ST

(ResMed, Australia; ResMed USA, San Diego)

**Because of an automatic shut-off feature in the ResMed bilevel (S9 VPAP and AirCurve), these devices should NOT be used for invasive ventilation unless no other options exist.**

The ResMed VPAP ST is designed to be a *noninvasive* ventilator. Incorporation of supplemental oxygen at > 15 LPM into the circuit anywhere distal to the blower should be undertaken with extreme caution.

At a set CPAP or EPAP > 10 cmH<sub>2</sub>O, oxygen flows > 15 LPM in a circuit with a standard exhalation port can result in an unanticipated device shut-off and patient harm. This shut-off does not occur at EPAP ≤ 10 cm H<sub>2</sub>O or when O<sub>2</sub> flow < 15 LPM.

At supplemental oxygen flows of 15 LPM, the maximum achievable FiO<sub>2</sub> will be no higher than 60%. If a patient requires FiO<sub>2</sub> > 60% or PEEP > 10 cmH<sub>2</sub>O, the use of another brand of bilevel or a conventional invasive ventilator should be considered.

**Exercise extreme caution when EPAP requirements exceed 10 cmH<sub>2</sub>O and FiO<sub>2</sub> requirements exceed 60%!**

# Use of Bi-level devices as invasive ventilators: guidelines for clinicians

Version 2.1 [Apr 17 2020]

Mount Sinai Health System

## Current Working Guidelines – Subject to Revision

These current working guidelines are subject to revision. It is expected this document will be updated and re-released as additional experience is accumulated.

Protocol developed by:

Jing Wang, MD  
Hooman Poor, MD  
Drew Copeland, RPSGT, CCSH  
David M. Rapoport, MD  
Charles A. Powell, MD, MBA

---

This document should be used as a clinical adjunct to the protocol “Repurposing bi-level ventilators for use with intubated patients while minimizing risk to health care works during insufficient supply of conventional ventilation for patients with COVID-19” and is shared with our health care colleagues to increase knowledge about potential solutions to increase the capacity and access to mechanical ventilation during the COVID-19 crisis. Icahn School of Medicine does not warrant the contents or effectiveness of the protocol, and the use and implementation of this protocol should be first reviewed and evaluated with each hospital’s medical staff.

## QUICK GLANCE: POTENTIAL CANDIDATES FOR USE OF BILEVEL FOR INVASIVE VENTILATION

**To be followed for support of intubated ICU patients if there is a crisis shortage of ventilators**

Ideal initial candidates for bilevel ventilation if there is a crisis induced shortage of ventilators are patients with either:

- Stable or improving P/F ratio
- or
- Decreasing or stable ventilator requirements

**We do not recommend use in newly intubated patients unless no other ventilators are available.** Newly intubated patients should be reassessed and considered for transition to ResMed VPAP-ST once they are stable, as detailed in [Table 1](#).

**Table 1:** Criteria

Parameter on Conventional Ventilator	Acceptable Limit
$\text{FiO}_2$	$\leq 85\%$ ( $<60\%$ for ResMed VPAP ST or AirCurve)
PEEP*	$\leq 15 \text{ cm H}_2\text{O}$ ( $<10 \text{ cm H}_2\text{O}$ for ResMed VPAP ST or AirCurve)
Driving pressure: ( $P_{\text{Plateau}} - \text{PEEP}$ ) or inspiratory pressure ( $P_i$ )*	$\leq 20 \text{ cm H}_2\text{O}$
<b>*Driving Pressure + PEEP</b>	<b>&lt;23</b>

Most Bilevel devices can deliver a maximum pressure (Driving Pressure + PEEP) of 25 cmH<sub>2</sub>O. For safety, given a potential increase of resistance in the bilevel circuit, we recommend that these devices are most appropriate for patients with settings on conventional ventilation as follows:

- If patient on Pressure Control mode: check that Inspiratory Pressure ( $P_i$ ) + PEEP is below 23 cmH<sub>2</sub>O
- If patient on Volume Control mode: check that plateau pressure is below 23 cmH<sub>2</sub>O

---

This document should be used as a clinical adjunct to the protocol “Repurposing bi-level ventilators for use with intubated patients while minimizing risk to health care works during insufficient supply of conventional ventilation for patients with COVID-19” and is shared with our health care colleagues to increase knowledge about potential solutions to increase the capacity and access to mechanical ventilation during the COVID-19 crisis. Icahn School of Medicine does not warrant the contents or effectiveness of the protocol, and the use and implementation of this protocol should be first reviewed and evaluated with each hospital’s medical staff.

## TRANSITIONING FROM CONVENTIONAL VENTILATOR TO BILEVEL VENTILATOR

Bilevel devices provide positive pressure ventilation in a manner analogous to pressure control ventilation on traditional ventilators.

*Calculate patient ideal body weight (IBW) from height and goal tidal volume (TV) of 6 - 8 cc/kg with plateau pressure <30.*

### Philips Resironics Device Settings:

**MODE:** ST (bi-level)

**EPAP = PEEP**

**IPAP:**

- If patient is on Pressure Control (AC/PC) mode:

$$\text{IPAP} = \text{PI} + \text{PEEP}$$

- If patient is on Volume Control (VC/PC) mode:

IPAP = plateau pressure (perform inspiratory pause maneuver)

**Resp Rate:** Match the patient's rate

**Ti:** 0.5-3 sec (see limits based on respiratory frequency; see chart ([Table 2](#))

**Rise Time:** 1

**Oxygen:** 15 lpm via first port, add additional O<sub>2</sub> via second port if needed to achieve goal FiO<sub>2</sub> 90-92%. Check PaO<sub>2</sub>/SpO<sub>2</sub>

**Table 2: Ti settings based on Respiratory Rate (RR):**

Respiratory Rate (bpm)	Max Ti = 30/RR
30	1
25	1.2
20	1.5
15	2.0
12	2.5

---

This document should be used as a clinical adjunct to the protocol “Repurposing bi-level ventilators for use with intubated patients while minimizing risk to health care works during insufficient supply of conventional ventilation for patients with COVID-19” and is shared with our health care colleagues to increase knowledge about potential solutions to increase the capacity and access to mechanical ventilation during the COVID-19 crisis. Icahn School of Medicine does not warrant the contents or effectiveness of the protocol, and the use and implementation of this protocol should be first reviewed and evaluated with each hospital’s medical staff.

## ResMed Device Settings:

**MODE:** ST (bilevel)

**EPAP = PEEP**

**IPAP:**

- If patient is on Pressure Control (AC/PC) mode:

$$\text{IPAP} = \text{PI} + \text{PEEP}$$

- If patient is on Volume Control (VC/PC) mode:

IPAP = plateau pressure (perform inspiratory pause maneuver)

**Resp Rate:** Match patient's rate

**Ti Max:** Based on respiratory frequency; see chart ([Table 2](#))

**Ti Min:** Based on respiratory frequency; see chart ([Table 2](#))

**Rise Time:** Min

**Trigger:** Low

**Cycle:** Low

**Oxygen:** 15 lpm via port—**DO NOT exceed 15LPM of supplemental oxygen**

**If an  $\text{FiO}_2 > 60\%$  is required, you must use a different bi-level device**

**Warning: With ResMed VPAP ST and AirCurve bi-levels, supplemental oxygen  $> 15 \text{ LPM}$  in a circuit with a standard exhalation port can result in an unanticipated device shut-off and patient harm**

**Table 3: Ti settings based on Respiratory Rate (RR):**

Respiratory Rate (bpm)	$\text{Ti Max} = 30/\text{RR}$	$\text{TiMin} = \frac{1}{2} \text{ TiMax}$
30	1	0.5
25	1.2	0.6
20	1.5	0.8
15	2.0	1.0
12	2.5	1.3

This document should be used as a clinical adjunct to the protocol “Repurposing bi-level ventilators for use with intubated patients while minimizing risk to health care works during insufficient supply of conventional ventilation for patients with COVID-19” and is shared with our health care colleagues to increase knowledge about potential solutions to increase the capacity and access to mechanical ventilation during the COVID-19 crisis. Icahn School of Medicine does not warrant the contents or effectiveness of the protocol, and the use and implementation of this protocol should be first reviewed and evaluated with each hospital’s medical staff.

**Whenever a patient is started on a bilevel ventilator or if a change in IPAP or EPAP is made, VERIFY TV reading on bilevel device display or on gas sampling/flow monitor:**

- TV > 6 – 8 cc/kg IBW → lower IPAP in 3-5 cm H<sub>2</sub>O increments until at/near goal
- TV < 6 - 8 cc/kg IBW with unacceptable hypercapnia/respiratory acidosis:
  - If not already at device maximum IPAP (25 cm H<sub>2</sub>O), increase IPAP in 3-5 cm H<sub>2</sub>O increments until TV at goal
  - If IPAP at maximum of 25 cm H<sub>2</sub>O, check ABG → if unacceptable degree of hypercapnia/respiratory acidosis, increase RR to maximum of 35 bpm
  - If IPAP at maximum of 25 cm H<sub>2</sub>O, RR at maximum of 35 bpm, with severe respiratory acidosis, decrease EPAP by 3-5 cm H<sub>2</sub>O (if oxygenation tolerated as measured)
    - NOTE: More advanced device support may be needed if unable to achieve adequate ventilation and oxygenation despite these adjustments.
- End-tidal CO<sub>2</sub> readings can be used as a surrogate indicator of changes in ventilation if tidal volume readings are not available
- Check FiO<sub>2</sub>

## OXYGEN and FIO2

*The circuit is usually set up with supplemental oxygen flow at 15 lpm. A second oxygen port can be used to add additional oxygen if needed.*

**WARNING: the Resmed VPAP ST and AirCurve have a feature that will cause an unexpected shut-down of the device if the supplemental O<sub>2</sub> flow exceeds the leak; this appears to the software as a “tube blocked” condition. DO NOT EXCEED 15 l/min of supplemental O<sub>2</sub> if using these devices and the set pressure is above 10 cm H<sub>2</sub>O.**

- Check FiO<sub>2</sub> on gas sampling/flow monitor if possible at the start of therapy
- FiO<sub>2</sub> may drop slightly if IPAP or EPAP is increased without increasing oxygen flow rates (especially if using single source of O<sub>2</sub> at 15 lpm)
- Check for changes in SpO<sub>2</sub> and/or PaO<sub>2</sub> after increasing IPAP or EPAP
- **DO NOT increase O<sub>2</sub> > 15 lpm if EPAP is ≥ 10 cmH<sub>2</sub>O**

---

This document should be used as a clinical adjunct to the protocol “Repurposing bi-level ventilators for use with intubated patients while minimizing risk to health care works during insufficient supply of conventional ventilation for patients with COVID-19” and is shared with our health care colleagues to increase knowledge about potential solutions to increase the capacity and access to mechanical ventilation during the COVID-19 crisis. Icahn School of Medicine does not warrant the contents or effectiveness of the protocol, and the use and implementation of this protocol should be first reviewed and evaluated with each hospital’s medical staff.

## Comments on LEAK

- The current set up of the circuitry provides the necessary degree of leak needed to prevent CO<sub>2</sub> re-breathing (this value cannot be displayed); this leak is filtered
- When all tubing circuitry is connected and working properly, the ResMed VPAP-ST screen should read a LEAK of 0 as this display is NOT the total leak, but the leak in excess of that intended and filtered. Other bilevel devices display the total leak. On other bilevel devices, the leak displayed is the total leak.
  - If reading goes above 0 on the Resmed devices, or above 40 l/min on other devices, there may be an unexpected leak in the system (cuff leak, disconnected tubing etc). This condition can result in:
    - Loss of delivered pressure, unexplained drop in patient SpO<sub>2</sub>, sudden change (up or down) in end-tidal CO<sub>2</sub>, and drop in TV readings,
    - Exposure of healthcare providers to *unfiltered* leak
- If you see this, check circuit, including all connections, ETT cuff inflation
